DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Name of Title: Student Identity Card Automation Platform

1. Abstract:

The Student ID Card Generator is a software application designed to automate the process of creating student identification cards efficiently and accurately. In educational institutions, generating ID cards manually can be time-consuming and prone to errors. This project aims to simplify and streamline the entire process by providing a user-friendly system that collects student details such as name, roll number, course, photograph, and contact information, and generates a professional ID card instantly.

A key feature of this system is the integration of QR code technology. Each generated ID card contains a unique QR code that stores or links to the student's digital profile. When the QR code is scanned using a mobile device, it displays the student's soft copy of the ID card or detailed information in digital format. This enhances security, enables quick verification, and reduces the need for physical documents.

This project is developed using web technologies such as HTML, CSS, and JavaScript (or any backend like Python/Java if used), ensuring ease of access and scalability. The system reduces manual effort, improves accuracy, and saves time, making it a practical solution for schools and colleges.

Built using modern web technologies such as HTML5, CSS3, JavaScript, React.js, and optionally Node.js with MySQL, the application ensures responsiveness, performance, and maintainability. The project demonstrates practical implementation of frontend frameworks, API integration, and state management.
